

Block Instrumentation for the Far Detector at Nova

Presented by Didier Muvandimwe
Hendrix College, Conway, AR

Intensity Frontier, PPD
Supervisor: Martin Frank,

Outline

- Neutrinos and Nova
- Instrumentation of blocks
 - Measure distance and strain on blocks
- Displaying the parameter readings in Synoptic
- Results and conclusion

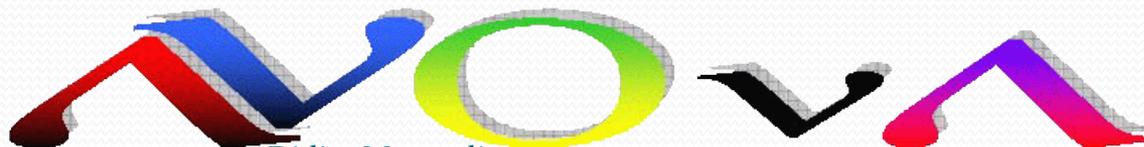

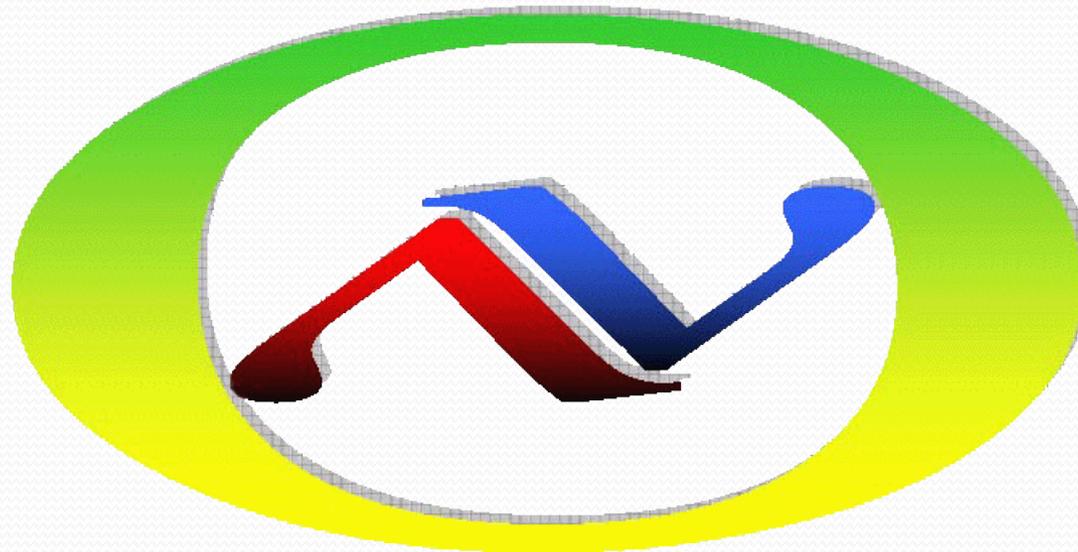

Neutrinos and their properties

- Muon, tau, and electron neutrinos
- Have a mass, but very small
- Abundant particles, rare interaction with other particles
- Difficult to detect
- Need large detectors

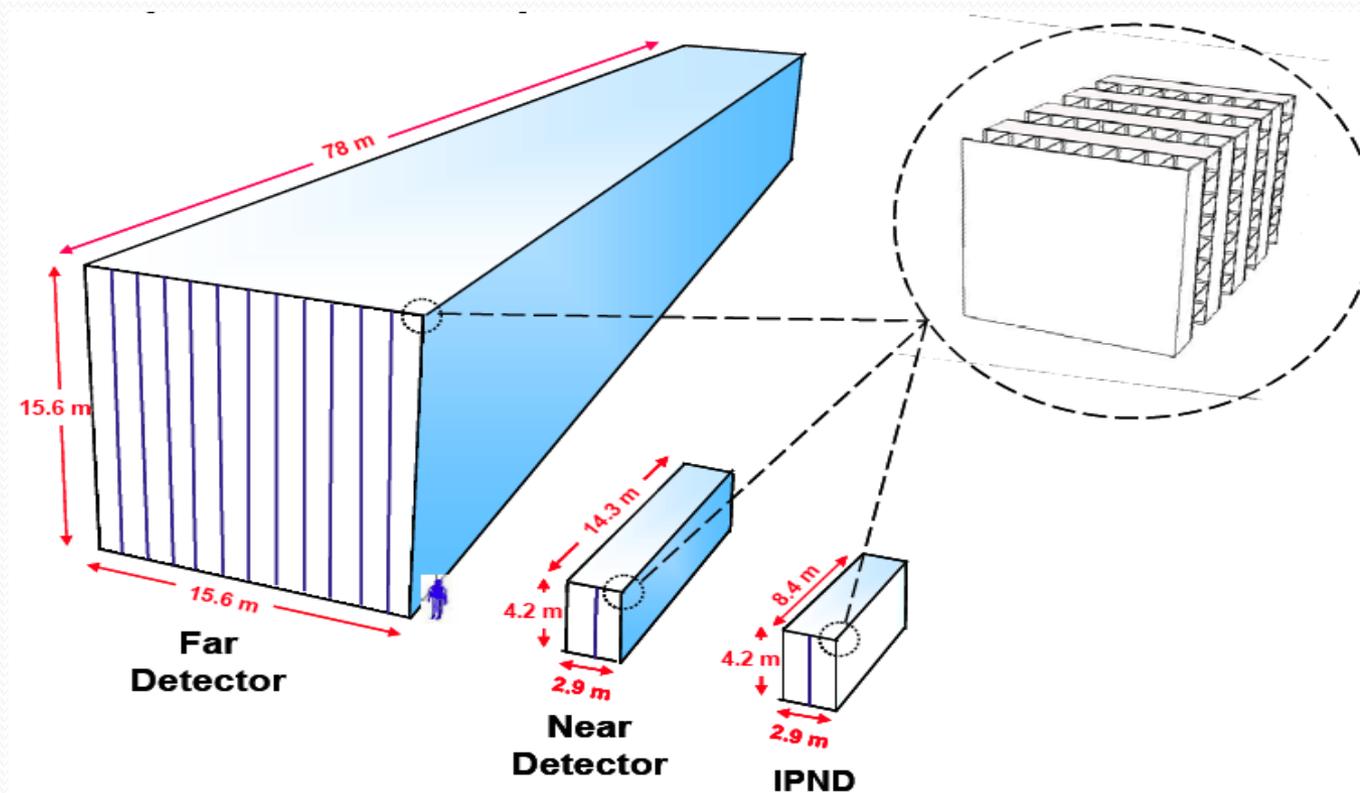

Nova objectives

- Oscillation of *muon* neutrinos to *electron* neutrinos
- Ordering of the neutrino masses
- Symmetry between matter and antimatter

- Near detector and Far detector
 - ND: 222 tons, and FD: 14 ktons
 - Far Detector: 28 Blocks, Each block: 384 PVC modules

Block instrumentation for the Far Detector

- Measuring *distances* between blocks and *strain* on some blocks
- Using Synoptic to build displays (GUIs)
- Monitoring these parameters in the Nova control room

Gap Distances

- 27 gaps (B00/B01 gap, B01/B02 gap,... B15/B16 gap,.....B26/B27 gap)
- Each Gap: 24 sensors: 18 north side and 6 south side.
- Each sensor has a name (sensor variable),
- Variable broadcasted through ACNET
- Variable imported from ACNET to display in Synoptic

Distance sensor Variables

- DIS- B# # - N/S XY
- B:[Block], ##: Block number, N or S: North or South side sensor, X or Y: horizontal and vertical position

How to measure the distances

- Changing resistor (R_{DIS}) and a known resistor (R_{VD}) of 20 K Ω
- Voltage divider across R_{DIS} and R_{VD}

Voltage Divider

$$V_{out} = \frac{R_2}{R_1 + R_2} V_{in}$$

- $V_{out} = V_{in} \cdot \frac{R_{VD}}{R_{DIS} + R_{VD}}$ (1)
- $\frac{V_{out}}{V_{in}} = \frac{R_{VD}}{R_{DIS} + R_{VD}}$, R_{DIS} expressed as ($R_{DIS} = mx + b$)
- $\frac{V_{out}}{V_{in}} = \frac{R_{VD}}{(mx+b) + R_{VD}}$ (3)

- $$X = \frac{1}{V_{out}} \left[\frac{1}{m} \cdot V_{in} \cdot R_{VD} \right] - \left[\frac{1}{m} \cdot V_{in} \cdot R_{VD} \right] (4)$$

- Letting, $C = \left[\frac{1}{m} \cdot V_{in} \cdot R_{VD} \right]$, and

$$D = \left[\frac{1}{m} \cdot V_{in} \cdot R_{VD} \right]$$

Then, $X = \frac{1}{V_{out}} [C] + [D] (5)$

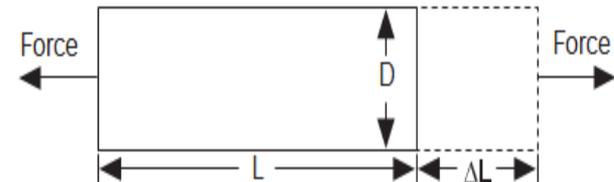

Strain and Strain gauge

- **Strain** is the amount of deformation of a body due to a force an applied force. Positive (tension) or negative (compressive)

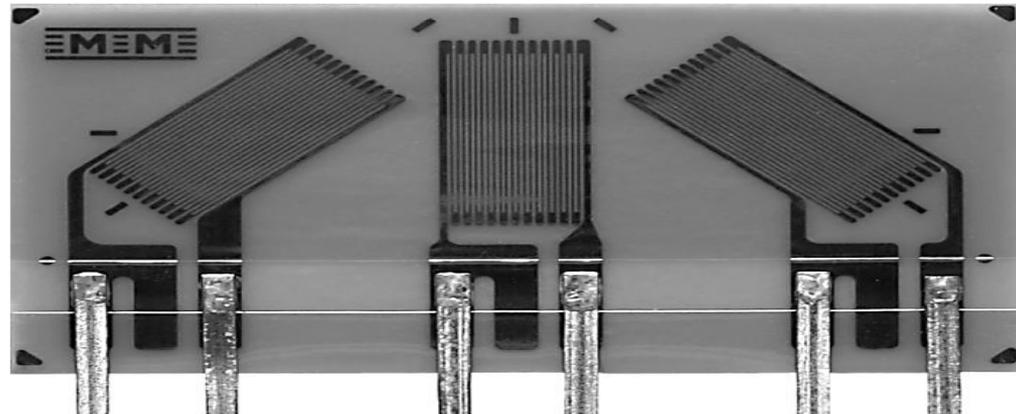

- $\epsilon = \frac{\Delta L}{L}$ (1), in micro-strain ($\mu\epsilon$).

- Use of **Strain gauge** to measure strain.

- **Gauge Factor (GF)**: the fundamental parameter of the strain gauge.
- Measures the material *sensitivity to the strain*. *i.e.* $GF=2$ for nova (metallic strain) gauges

$$\diamond GF = \frac{\Delta R/R}{\Delta L/L} = \frac{\Delta R/R}{\epsilon}$$

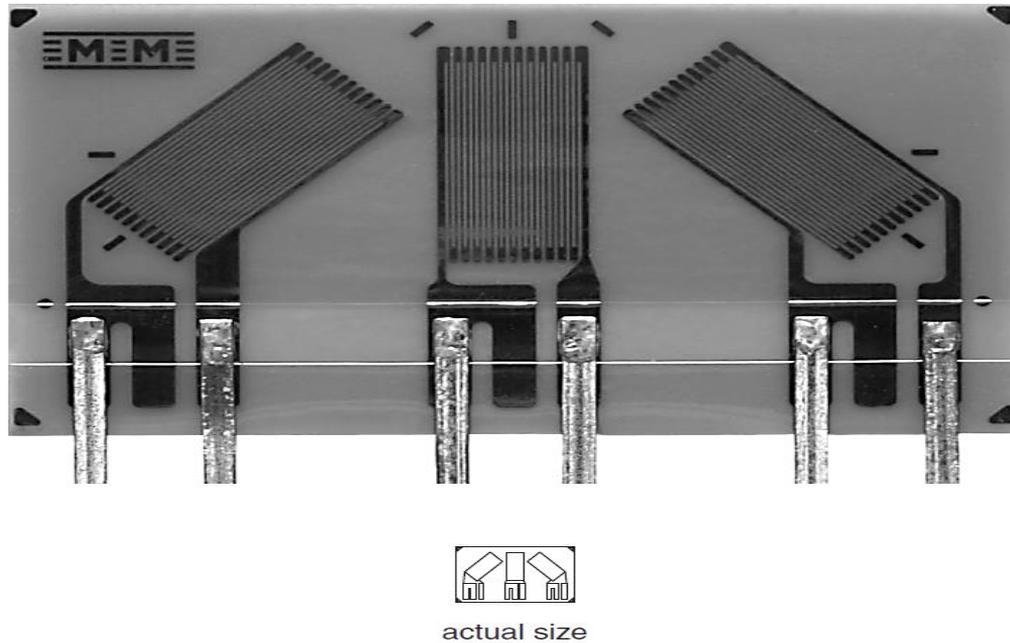

actual size

How to measure strain

- 3 gauge strain sensor or rosette ($\varepsilon_1, \varepsilon_2, \varepsilon_3$)

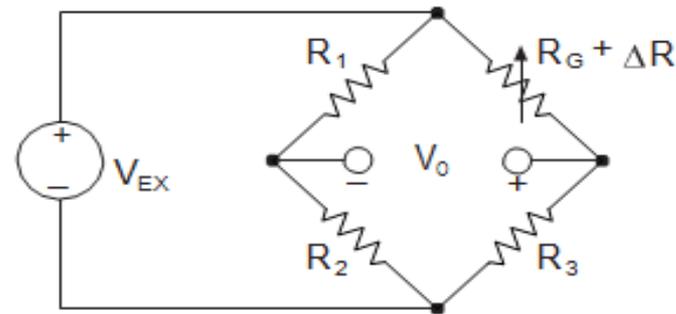

- Connecting a strain gauge to a modified *Wheatstone bridge*
- Slight modification to a quarter bridge circuit

- Setting $R_1 = R_2, R_3 = R_G$, and the GF equation, $\Delta R = R_G \cdot GF \cdot \varepsilon$.

- $$\frac{V_0}{V_{EX}} = -\frac{GF \cdot \varepsilon}{4} \left(\frac{1}{1 + GF \cdot \frac{\varepsilon}{2}} \right) \quad (7)$$

- From (7), letting $V_r = \frac{V_0}{V_{EX}}$, then

- $$\varepsilon = \frac{-4 \cdot V_r}{GF(1 + 2V_r)} \quad (8)$$

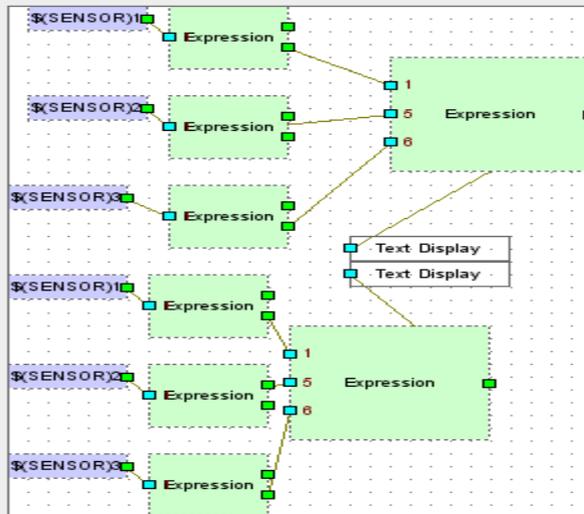

- Measuring and reading ($\varepsilon_1, \varepsilon_2, \varepsilon_3$).
- However, displaying principal strain ($\varepsilon_p, \varepsilon_q$)

$$\square \varepsilon_p = \frac{\varepsilon_1 + \varepsilon_2}{2} + \frac{1}{\sqrt{2}} \sqrt{(\varepsilon_1 - \varepsilon_2)^2 + (\varepsilon_2 - \varepsilon_3)^2}$$

$$\square \varepsilon_q = \frac{\varepsilon_1 + \varepsilon_2}{2} - \frac{1}{\sqrt{2}} \sqrt{(\varepsilon_1 - \varepsilon_2)^2 + (\varepsilon_2 - \varepsilon_3)^2}$$

($\varepsilon_p, \varepsilon_q$) are displayed in Synoptic

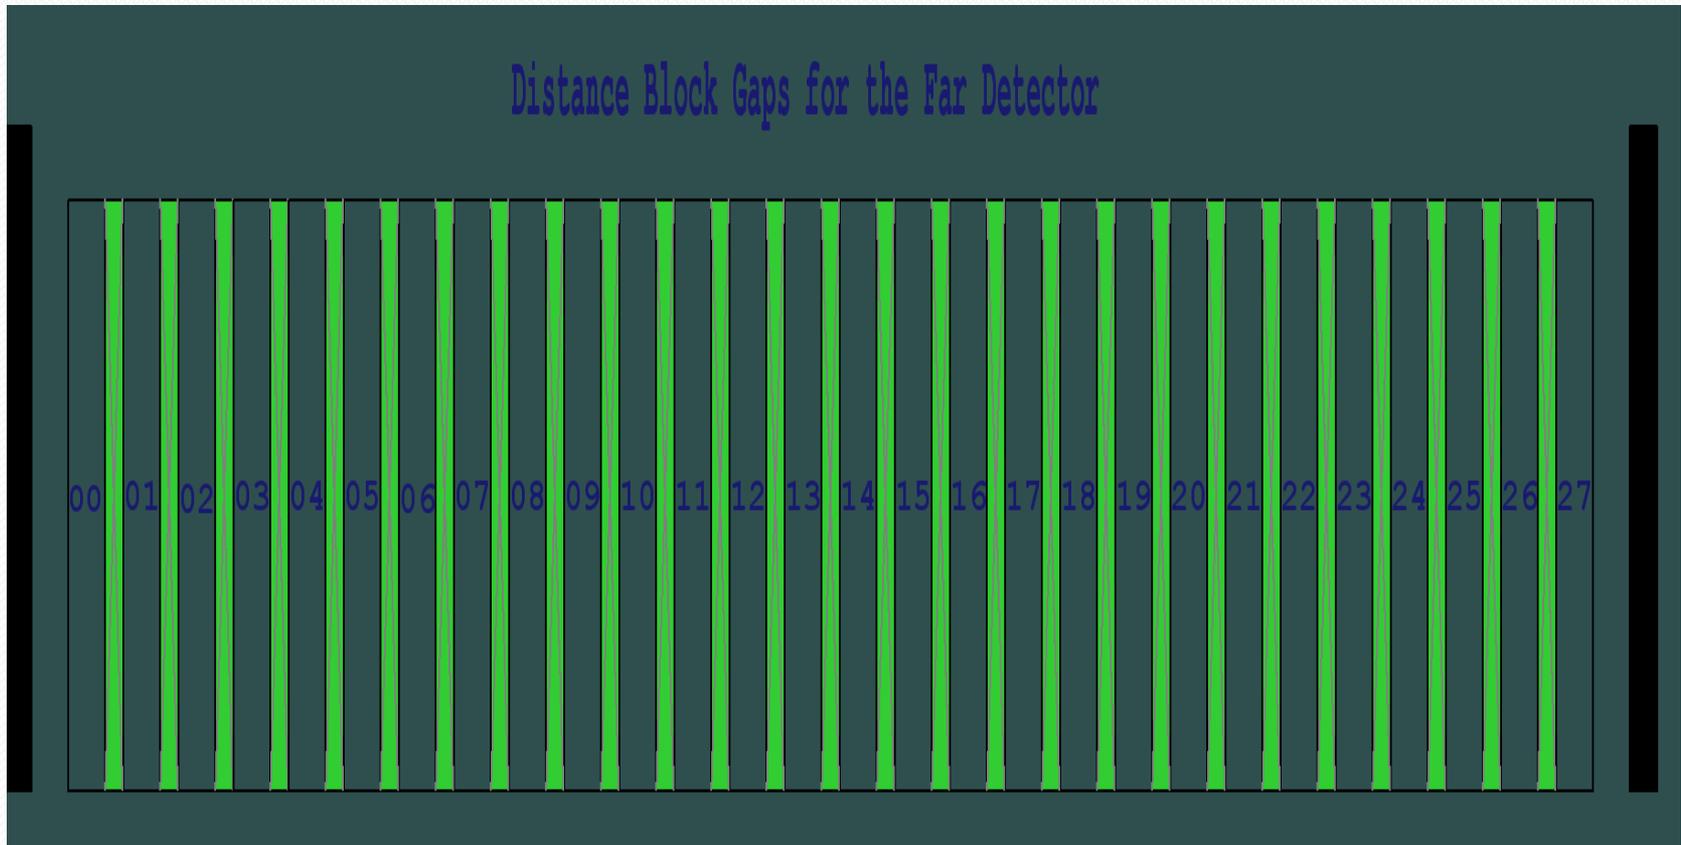

Epsilon P: 1069.708

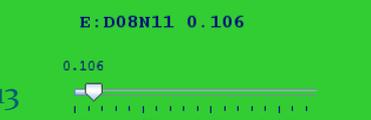

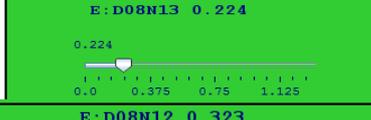

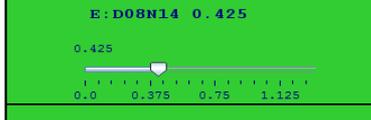

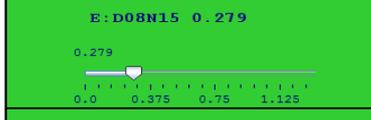

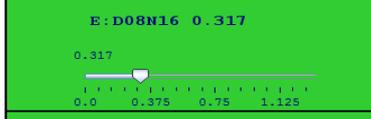

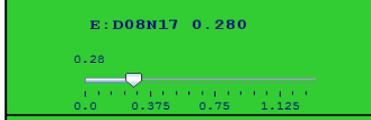

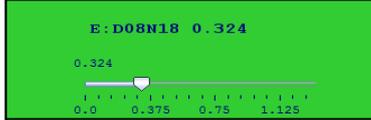

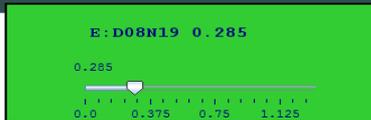

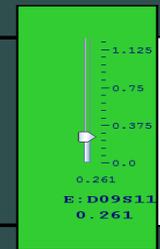

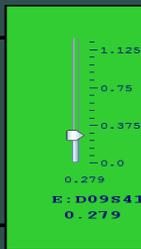

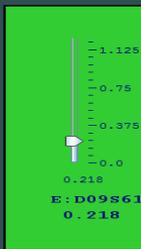

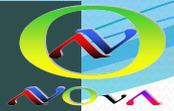

Epsilon Q: 31.313

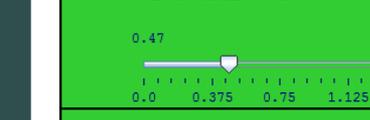

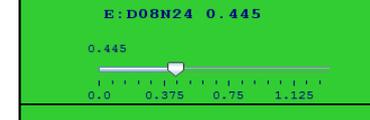

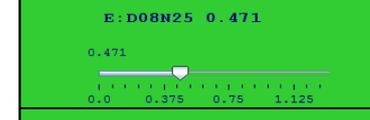

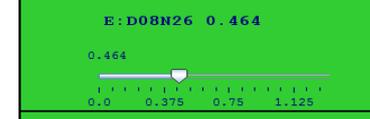

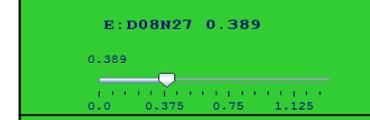

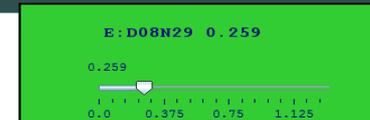

Results

- Distance readings with alarms
 - http://www-bd.fnal.gov/synoptic/display/Nova_Far/Displays/BlockGapOvervie

Distance Block Gap

Strain readings

- Rosette $(\epsilon_1, \epsilon_2, \epsilon_3) \longrightarrow (\epsilon_p, \epsilon_q)$

Conclusion and Future work

- Distance readings displays have been completed
 - Easy control and monitoring in Nova control room
 - Knowing broken sensors, detect any issues with the sensors
 - Recognizing out of range (abnormal) readings
- Strain displays are in progress and continue to work on them
 - Overview for all 8 blocks with strain sensors on them
 - Have all strain readings as it is for the distance display
